

Wuhan and the polluted air as a cause of epidemic illness

*(To read about Jon's mega-collection, **The Matrix Revealed**, [click here.](#))*

At the very beginning of my coverage of the "China epidemic," I cited evidence that the air quality in Wuhan is chronically dangerous.

Among other sources, I referred to a Yale review which stated that the mixture of toxic elements in the air is unprecedented in human history. The synergistic effects of these individual toxins is unknown.

I also mentioned the large street protests against air quality in Wuhan that took place last summer. These protests were also carried out in other Chinese cities. The government was obviously alarmed at the nascent rebellion.

Those protests are now gone. Because the cities are locked down. It's all about "the virus" as the cause of illness.

Horrific air quality brings on lung infections of all kinds, including pneumonia. Pneumonia is THE illness attributed to the coronavirus. How convenient.

The Chinese government has recently ruled that testing patients for the coronavirus isn't necessary for a diagnosis of "epidemic illness." A CT scan of the lungs is sufficient. If the patient thus shows signs of pneumonia, he is labeled "a coronavirus case."

Air quality? Brushed aside.

Assessing studies of annual pneumonia deaths in China---

covering years long before the supposed emergence of the new human coronavirus---I settled on the estimate of 300,000 deaths a year.

Assuming this death rate is more or less constant, hundreds of thousands of people could now be called deceased "coronavirus cases" without a flicker of interest in the actual cause of their illness. Those CT scans, picking up signs of pneumonia, and absurdly leading to the label "coronavirus," are a perfect tool for deception.

Recently, I found an article from cambodiacapital.com, dated February 7, 2020: "*Polluted air' could be an important cause of Wuhan pneumonia*". It makes some interesting comments about Wuhan air quality. The article also speculates that "the virus" is carried on particulate pollutants, a claim I find completely unsupported---but the remarks about pollution are worth repeating:

"...three factors. First, the increase of static wind in the horizontal direction, which is not conducive to the diffusion and dilution of atmospheric pollutants. Second, the emergence of a temperature inversion layer in the vertical direction, which makes it difficult for pollutants to move upwards and are blocked at low altitudes and near the ground. Third, the increase of suspended particulates in the air. These three conditions are all available during the high incidence period of Wuhan pneumonia."

"According to data released by the Wuhan Bureau of Ecology and Environment, the moment when a large number of pneumonia cases emerged in Wuhan was during the period from Jan 19, 2020, to Jan 23, 2020, and the Wuhan air during this period was at the stage of serious pollution. The indices are all higher than 100. This means that the outbreak period of Wuhan pneumonia coincides with the severe period of air pollution and this is one of the reasons. The second supporting reason is that the high incidence areas of Wuhan pneumonia coincide with the severe air pollution areas. We observed by randomly taking one day as a sample and found out that the area with the highest level of air pollution in Wuhan was Huanan Wholesale Seafood Market. This shows that even in 'normal weather', the air pollution in the seafood market area was the relatively worst area in Wuhan...Therefore, it is not

accidental that Wuhan Huanan Wholesale Seafood Market has become a high-incidence area of Wuhan pneumonia..."

You'll recall that, at first, reports circulated about the coronavirus emerging in that Market and "jumping species from animals to humans." These reports didn't mention highly dangerous air pollutants "jumping" into the lungs of humans.
